Name _____ Period _____ Date _____

5-1 Lesson Quiz: nth Roots, Radicals, and Rational Exponents short form

Question numbers match the Savvas Lesson Quiz. Questions 1 and 4 are not on this form. Show your work.

2. Select **all** expressions that are equivalent to $x^{\frac{3}{4}}$.

- ☐ **A.** $\left(x^3\right)^{\frac{1}{4}}$
- ☐ **B.** $x^{\frac{8}{6}}$
- ☐ **C.** $\left(x^{\frac{1}{4}}\right)^{\frac{2}{4}}$
- ☐ **D.** $\left(x^{\frac{1}{4}}\right)^3$
- ☐ **E.** $\sqrt[3]{x^4}$
- ☐ **F.** $\sqrt[4]{x^3}$

Work:

3. Explain what $243^{\frac{3}{5}}$ means, then evaluate it. (Circle one word in each box.)

$243^{\frac{3}{5}}$ is the [square / cube / fourth / fifth] root of 243

[squared / cubed / to the fourth power / to the fifth power].

Its value is [3 / 9 / 27 / 81].

Work:

5. Solve the equation $-4x^3 = 32$.

$x =$ _____

Work:

Scoring: Question 3 and Question 5 are 10 points each. Question 2 is a bonus of up to 5 points (all three correct boxes, none wrong). Total out of 20.

5-1 Lesson Quiz, short form: answer key

---

2. A, D, F. A: $\left(x^3\right)^{\frac{1}{4}} = x^{\frac{3}{4}}$. D: $\left(x^{\frac{1}{4}}\right)^3 = x^{\frac{3}{4}}$. F: $\sqrt[4]{x^3} = x^{\frac{3}{4}}$ (index 4 is the denominator, power 3 the numerator). Not B: $x^{\frac{8}{6}} = x^{\frac{4}{3}}$. Not C: $\left(x^{\frac{1}{4}}\right)^{\frac{2}{4}} = x^{\frac{1}{8}}$. Not E: $\sqrt[3]{x^4} = x^{\frac{4}{3}}$ (index and power swapped). Savvas quiz item 2, DOK 2, skill A82; taught by Example 2, rehearsed by the packet's Practice. **Bonus 5:** A, D and F with no extra box; 3 for two of the three and none wrong; 0 otherwise.

3. fifth; cubed; 27. $243^{\frac{3}{5}}$ is the fifth root of 243 cubed: $\left(\sqrt[5]{243}\right)^3 = 3^3 = 27$, because $3^5 = 243$. Savvas quiz item 3, DOK 2, skill A82; taught by Example 2 (Try It 2 is the same task). **10 points:** 3 for *fifth*, 3 for *cubed*, 4 for 27 with work (243 written as 3^5, or the fifth root found first).

5. $x = -2$**.** Divide by -4: $x^3 = -8$. Take the cube root of both sides (raise to the $\frac{1}{3}$ power): $x = \sqrt[3]{-8} = -2$. Check: $-4(-2)^3 = -4(-8) = 32$ ✓. The index 3 is odd, so there is exactly one real solution, and it is negative. Savvas quiz item 5, DOK 2, skill A84; taught by Example 5 (Try It 5a). **10 points:** 4 for $x^3 = -8$, 3 for the cube root step, 3 for $x = -2$. Common error: $x^3 = -128$ (multiplying instead of dividing) or $x = \pm 2$ (the even-index $\pm$ used on an odd index).

Items left off this form (available for a retake or Form B): Savvas item 1, the real fourth roots of 256 (answer 4 and -4; DOK 1, A83; Example 1, cut, though the $\pm$ move for an even index is Example 5B); Savvas item 4, simplify $\sqrt[4]{81m^{12}n^4}$ with all variables positive (answer C, $3m^3n$; DOK 1, A80; Example 4, cut in the fast packet).

IXL replacement: SmartScore 70 or above on 9TM, KJX and U42 replaces this quiz with 20/20.
